

Goals for rebuilding momentivesoftware.com

Performance

- Lighthouse/PageSpeed scores consistently 90+ for representative pages
- Time to First Byte under 800ms and mobile LCP under 2.5s for representative pages
- No uncaught JavaScript errors on production pages
- Eliminate recurring frontend issues (font loading failures, broken cards, layout instability, etc.)

Editor experience

- A non-developer can complete the 5 most common editing tasks without assistance (define tasks before launch; test with an actual editor)
- No editing tasks require direct file or database access

Developer experience, code quality, maintainability

- Routine content changes don't require developer assistance
- Any developer on the team can fix an issue or add a feature independently
- Available blocks and design patterns are documented in a style guide that developers and outside designers can follow
- Git-based deployment workflow
- Favor WordPress-native or custom solutions over plugins where they improve maintainability, performance, or reliability
- Simplify the WordPress dashboard by removing unused or redundant functionality
- Local development environment reproducible for all contributors

Accessibility

- WCAG 2.1 AA compliance (audit before and after relaunch)
- All interactive elements keyboard-navigable
- Story cards and other linked components use correct accessible patterns

Business continuity

- Site can be maintained and extended without the original agency (500 Designs)
- No undocumented dependencies or proprietary systems without an exit path
- At least two team members understand every part of the system

Metrics and validation

- Baseline data gathered for all measurable criteria before relaunch
- Editor confidence survey (30 days post-launch)
- Core Web Vitals re-measured at 30 and 90 days post-launch
- Success criteria reviewed with stakeholders before launch, not after
